Functions

No additional function (OFF)

If the supply voltage U is applied (green LED illuminated) and the cumulative resistance of the PTC-circuit is less than 3.6kΩ (standard temperature of the motor), the output relays switch into on-position. Pressing the test/reset key under this conditions forces the output relays to switch into off-position. They remain in this state as long as the test/reset key is pressed and thus the switching function can be checked in case of fault. The test function is not effective using an external reset key. When the cumulative resistance of the PTC exceeds 3.6kΩ (at least one of the PTCs has reached the cut-off temperature), the output relays switch into off-position (red LED illuminated). The output relays again switch into on-position (red LED not illuminated), if the cumulative resistance drops below 1.8kΩ by cooling down of the PTC and either a reset key (internal or external) was pressed or the supply voltage was disconnected and re-applied.

Zero voltage latch (N)

If the supply voltage is interrupted and the additional function "Zero voltage latch" (+N or +N+K) is activated, the actual status of the output relays is stored and they switch into off-position if necessary. If the supply voltage is re-applied the status is restored. If this function is activated a fault can only be cleared by pressing the internal or external reset key.

Short circuit monitoring (K)

In case of a line break or a short circuit of the probe line (cumulative resistance less than 20Ω) the output relays switch into off-position (red LED illuminated) if the additional function "Short circuit monitoring" (+K or +K+N) is activated. Under these conditions however the output relays do not change their state, neither by pressing a reset key nor by disconnecting and re-applying the supply voltage.
